OZONE For LIFE

The Green House Effect

There is a natural process of the Earth's atmosphere that keeps the planet warm enough to support life. This process is called the greenhouse effect. The greenhouse effect is caused by the presence of greenhouse gases in the atmosphere. These gases trap heat from the sun and prevent it from escaping back into space. This process is essential for life on Earth. Without the greenhouse effect, the Earth would be too cold to support life.

Greenhouse gases include carbon dioxide, methane, and water vapor. These gases are produced by natural processes and human activities. The increase in greenhouse gases due to human activities is causing global warming and climate change.

Save The Ozone Layer

The ozone layer is a layer of ozone in the atmosphere that protects life on Earth by absorbing most of the sun's harmful ultraviolet radiation. The ozone layer is being depleted by human activities, particularly the release of chlorofluorocarbons (CFCs) and halons. This depletion is causing global warming and climate change.

Global Warming and Environmental Policy

The greenhouse effect is a natural process that warms the Earth's surface. This effect has been studied by scientists for decades and is well understood. The increase in greenhouse gases due to human activities is causing global warming and climate change. This is a global problem that requires international cooperation to solve.

Save the Ozone Layer
